

DASH™ HTS LC/MS Columns

- The benchmark in based deactivated silica columns
- Sharp peaks and improved symmetry for basic compounds
- Value and performance from a globally referenced column

DASH HTS columns are packed to the same high standards as our analytical columns, and offer superior chromatographic resolution in a design that eliminates the need for endfittings and wrenches during column change over. This makes column installation and change over faster for high throughput systems.

DASH HTS columns are offered in 20x2.1mm size in a variety of high performance 5µm particle size phases – including Hypercarb, BioBasic, AQUASIL C18 and BETASIL.

As the columns are designed for high throughput laboratories, we offer a cost-effective solution in DASH HTS multi-packs. Packs of 3 and 10 columns can be purchased, with a quality control packing certificate for one column in every pack.

We recommend DASH HTS columns are used with PEEK® tubing and endfittings. We offer a DASH endfitting and a 0.5µm porosity DASH filter, which are both knurled in black PEEK finish for ease of use.

DASH HTS columns are available in any Thermo Scientific phase in single or multi packs. Please contact us for more information if you do not see the exact column that you are interested in.
